

- This is how the events of a single pixel look like:

+: noisy

-: repeatable

Precision/repeatability

- Precision of LED * photoreceptor * buffers * ...

*interval between successive “-”
(ignoring “+” completely)*

*interval between successive “-”
(ignoring “+” completely)*

- Frequency between successive “-” signals, averaged over all pixels.

led, static**led, motion****no led, motion**

- Looks like the frequencies can be recovered with very simple clustering.

- Do you want to fit more signals?
Divide the image in big overlapping patches.
